The Ford Focus uses a belt driven water pump to circulate coolant -- a 50/50 mix of water and antifreeze -- through the engine. As the coolant moves through the engine it absorbs heat generated by the combustion process. Heat coolant is released to the air in the radiator as air is pulled across it's cooling fins by the electric fan.

If I recall from my Scangauge, the temp gauge is at its normal mid-range point when the engine is in the 160-170 deg range. But the engine continues to warm up slowly to around 200 deg for many minutes after that with little to no gauge movement. If I remember I'll try it again later this week and pay close attention to it.
