The general solution is $a(t) = a_0 \exp(-i\omega t)$, where a_0 is a complex constant. The energy of the oscillator is $E = \omega |a_0|^2$. For $t \rightarrow 0$, we have $a_0 = 0$. In the presence of H_{ph} the Hamiltonian becomes $H = \omega(a^*a) + b(a + a^*) \sin \omega t$. Therefore, we have $\dot{a} = \{a, H\} = -i\omega a - ib \sin \omega t$.

Goldstein 2.2 The canonical momentum p is defined as $p = \frac{\partial L}{\partial \dot{q}} = \frac{\partial T}{\partial \dot{q}} - \frac{\partial U}{\partial \dot{q}}$ (1) where $T = T(r_i; \dot{r}_i)$ and $U = U(r_i; r_{-i})$ are kinetic and potential energy of the system, which then define the Lagrangian $L = T - U$.
