Visual Basic provides full support for object-oriented programming including encapsulation, inheritance, and polymorphism. Encapsulation means that a group of related properties, methods, and other members are treated as a single unit or object. Inheritance describes the ability to create new classes based on an existing class.

The representation of graphical objects, such as lines, arcs, circles, and rectangles, with mathematical formulas. This method of describing objects enables the system to manipulate the objects more freely. In an object-oriented system, for example, you can overlap objects but still access them individually, which is difficult in a bit-mapped system.

In the 1960s, object-oriented programming was put into practice with the Simula language, which introduced important concepts that are today an essential part of object-oriented programming, such as class and object, inheritance, and dynamic binding. Simula was also designed to take account of programming and data security.
